Assignment Brief

1. The following wireframe depicts creation of a new Ticket and the initial 2 steps of Handling of a new ticket.
2. Use seeded accounts for the Client, Facility Manager, Department POC and Worker roles. Provide a simple way to switch between these accounts, using standard authentication. Enforce ticket visibility and action permissions on the backend for the authenticated user: hiding UI controls alone is insufficient. Registration, password reset and user-management screens are not required.
3. Only one sample record has been listed under the Open Tickets tab for each type of user. The implementation should include **'Paginated Listing'** of multiple records.
4. For the purpose of this assignment, the Concerned Facility Manager means the Facility Manager who takes care of the Property where the Client-Office is located.
5. For the purpose of this assignment, the concerned Department is the department to which the issue mentioned on the Ticket belongs.
6. For all users, implement Filters based on - Client Name, Concerned Department, Concerned Facility Manager, and Ticket Status
7. For all users, implement Sort based on - Created Time (Older First/Newest First)
8. For all users, implement Search based on - Ticket Issue text.

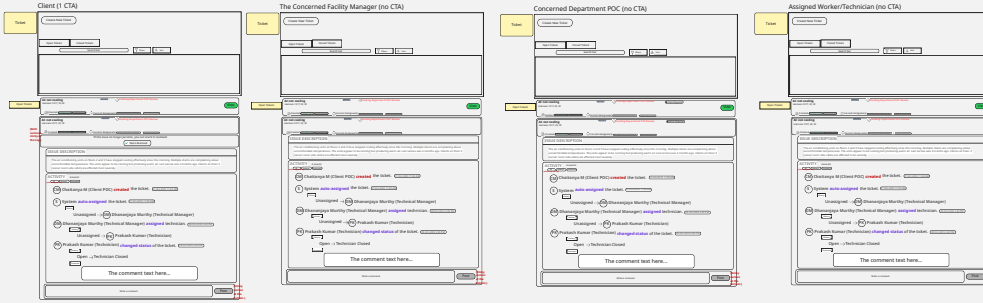

1. Ticket Creation

2. Ticket Handling

Note: For the purpose of this assignment, the flow ends here. No further handling is required.
